

Introduction to Computational Neuroscience

Practice VI: Neuron Network Model

Ilya Kuzovkin, Raul Vicente

March 30, 2014

On the lecture we have seen through one example of a neural network model. It was based on a real article and real research. This time your task will be to read another article and extract pieces of knowledge from it.

Request: Please record the time you will spend on this homework and add it to the report. This is just for me to balance the amount and the difficulty level of the exercises.

The difference between a scientific article and most of the other texts is that in an article almost every sentence has a meaning. This is why reading an article is harder than reading any other text: you have to digest a sentence before you move on. As a result you will need to read it slower and several times (2-3). I suggest you do it like this:

- a) First read the whole text skipping the technical details. The idea of this first run is to get the feeling of the article as a whole: general pipeline, research objective, something about methodology, results, etc.
- b) Now once you have the general idea why those people wrote an article you can do the second read, aiming at understanding the methods they use: equations, the data, experimental setup, performance measures, the exact meaning of the results.
- c) By now you have pretty decent understanding what is going on there. However when you'll think about particulars you will feel that you don't quite get them. So you perform a third read, maybe focusing on the pieces of text you are interested in.

Exercise 1: "A Model of Binocular Rivalry Based on Competition in IT" (2.5pt)

Download an article from the practice session web page: https://courses.cs.ut.ee/2014/neuro/spring/uploads/Main/binocular_model.pdf. Understand it and answer the questions below. The answers you give should be **detailed and explanatory**: imagine that you have to explain those things in details to your classmate who knows nothing about neuroscience.

Note that there might be a couple of questions, which are not explicitly answered in the article. If you encounter one of those you can either tell what do you think the answer might be or report that this information is not given in the article.

Q₁ : Explain the title of the article.

Q₂ : What is the scientific question raised in this article?

Q₃ : Enlist and describe the experimental findings which are mentioned in the article and which are relevant to the scientific question.

Q₄ : Part of which area of the brain we are going to model? Why this area is relevant to the scientific question?

Q₅ : Explain in general terms what does the equation (1) do?

Q₆ : How do they model noise?

Q₇ : What Figure 2.A is trying to convey?

Q₈ : What types of neurons (nodes) does the model have? How those neurons (nodes) behave?

Q₉ : What is the topology of the network (random, layers, lattice, ...)? What is the logic behind it?

Q₁₀ : On the top of Figure 1 we have a box called "inhibitor". What is its role?

Q₁₁ : What is the firing rate adaptation and what is its role in the big picture?

Q₁₂ : What do they say about the size of the network?

Q₁₃ : What do they say about the density of the network?

Q₁₄ : Describe the connections between the units (strength, delay, ...)

Q₁₅ : How do they model the input to the network?

Q₁₆ : Summarize the the meaning of the model and why it might be useful.

Exercise 2*: Find & run an implementation of some neuron network model (1pt)

Have a look at this page <https://senselab.med.yale.edu/ModelDB>. This a database with a huge amount of implementations of different models. Your task it to:

- a) Find a network model (not a single neuron) which you like. You can just click around there or look at some specific lists:
 - By topic: <https://senselab.med.yale.edu/ModelDB/FindByConcept.asp>
 - Only networks: <https://senselab.med.yale.edu/MicroCircuitDB/ListByModelName.asp?c=19&lin=-1>
 - Matlab implementations: <https://senselab.med.yale.edu/ModelDB/ModelList.asp?id=36835>
 - etc...
- b) Explain in the report what is the model about.
- c) Run the code, play with parameters, report few figures and explain what these figures show.

Exercise 3: Neuron network models vs. Artificial neural networks (0.5pt)

You know that in the field of artificial intelligence and machine learning there are algorithms called artificial neural networks. How those thing are related to the neuron network models we are talking about here? Terms *neuron network model* and *artificial neural network* seem to have a lot in common. However you must know that they are far from being the same thing. Compose a list (or a table) with the similarities and the differences between the two concepts and explain it to the class.

Please submit a PDF report with answers to the questions and comments about your solutions. Your report should contain figures, explanations, the essential parts of the code you have produced, etc. If the code is too massive you can add it to the submission and upload everything as a **zip** archive. But single PDF is preferred.
